SARS coronavirus HB
SARS coronavirus HB
Viruses; ssRNA positive-strand viruses, no DNA stage; Nidovirales;
Coronaviridae; Coronavirus.
                                                                                                                                         Timani, K.A., Ye.L., Ye,L., Zhu,Y., Wu,Z. and Gong,Z. Cloning, sequencing, expression, and purification of SARS-associated coronavirus nucleocapsid protein for serodiagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Viruses; ssRNA positive-strand viruses, no DNA stage; Nidovirales; Coronaviridae; Coronavirus.

Legistics C virus (HCV); (4) inducing targeted RNA interference toward HCV in hepatic cells; (5) inhibiting replication of HCV; (6) a vector comprising a DNA segment encoding the RNA molecule; (7) a host cells carrying the vector of (6); (8) inhibiting replication of HCV in cells carrying HCV; (9) treating hepatitis C in a subject; (10) a modified carrying HCV; (9) treating hepatitis C in a subject; (10) a modified signal adouble-stranded RNA molecule of 10-30 uncleotides in length, which mediates RNA interference toward a target agent or virus and is linked to at least one receptor-binding ligand; and collections have antiinflammatory, hepatoropic and virucide activities.

(11) inducing targeted RNA interference in a patient. The modified siRNA cells are useful for inactivating virus in mammalian cells. The siRNAs are useful for treating hepatitis C virus, hepatitis B virus, hepatitis D virus, hepatitis E virus, Ebola virus, influence virus, networkus, poliovirus, human papilloma virus, recovirus, poliovirus, human papilloma virus, metapneumoniavirus or coronavirus infections. The methods of the invention can be used to correct or compensate for cellular physiological aborantities involved in conferring susceptibility to viral infections in patients.

The present sequence represents the SARS coronavirus nucleotide sequence,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
              insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

A gene encoding asparaginylendopeptidase is claimed. 8 DNA sequences are given (AAOSO559-66). The enzyme is a procease derived from a seed of Canavalia ensiformis which selectively hydrolyses C-terminus amide bond of L-asparagine residue (see AAR4303 and AAR43041). The enzyme is useful for protein fragmentation and enzymatic peptide synthesis. The primers given in AAOSO576-77 and AAOSO583-90 were used in the isolation of the fragments given in AAOSO569-75 and AAOSO569-75 and AAOSO569-75 and AAOSO578-79, by PCR. (Updated on 25-WAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A gene encoding asparaginylendopeptidase is claimed. 8 DNA sequences are given (AAQSOS59-66). The enzyme is a protease derived from a seed of Canavalia ensiformis which selectively hydrolyses C-terminus amide bond of L-asparagine residue (see AAR43033 and AAR43041). The enzyme is useful for protein fragmentation and enzymatic peptide synthesis. The primers given in AAQSOS76-68, AAAQSOS76-77 and AAQSOS633-90 were used in the isolation of the fragments given in AAQSOS69-75 and AAQSOS69-75 and AAQSOS78-79, by PCR. (Updated on 25-WAR-2003 to correct PA field.)

                                                                                                  A gene encoding asparaginylendopeptidase is claimed. 8 DNA sequences are given (AAQ50559-66). The enzyme is a protease derived from a seed of Canavalia ensiformis which selectively hydrolyses C-terminus amide bond of L-asparagine residue (see AAR43033 and AAR43041). The enzyme is useful for protein fragmentation and enzymatic peptide synthesis. The primers given in AAQ50576-68, AAQ50576-77 and AAQ50583-90 were used in the isolation of the fragments given in AAQ50569-75 and AAQ50578-77, by PCR. (Updated on 25-WAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A gene encoding asparaginylendopeptidase is claimed. 8 DNA sequences are given (AAQS0559-66). The nucleic acids and proteins identified in the present invention are useful in characterising the physiology of these archae and can be used in therapeutic, industrial or laboratory techniques. AAA55227 to AAA55260 represent promoter sequences from Cenarchaeum symbiosum. AAA55261 to AAA55269 represent PCR primers and probes used in examples

Determining susceptibility of an individual to joint space narrowing, osteophyte development and/or joint pain comprises identifying whether the individual has at least one polymorphism in a polymucleotide encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of determining susceptibility of an individual to joint space narrowing and/or osteophyre development and/or joint pain comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding at least one of the protein
                                                                                                                                                                                                                            proteins isolated from the non-thermophilic crenarchaeote Cenarchaeum symbiosum. The nucleic acids and proteins identified in the present invention are useful in characterising the physiology of these archae and can be used in therapeutic, industrial or laboratory techniques. AAA55227
                                                                                                                                                                                                          AAA55186 to AAA55226 and AAY90913 to AAY90951 represent nucleic acids and
                                                                                                   crenarchaeote Cenarchaeum symbiosum, useful in characterizing the physiology of these archae and in therapeutic, industrial or laboratory
                                                                                                                                                                                                                                                                                              to AAA55260 represent promoter sequences from Cenarchaeum symbiosum. AAA55261 to AAA55269 represent PCR primers and probes used in examples

                                                                                                                                                                                                                                                                                                                                              AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1)
amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic
activity, and can be used in gene therapy and vaccine production. (1)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (1) expression. For
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (1) by expressing inactive proteins or to
supplement the patients own production of (1). Additionally, (1)
cuplement displays be used to produce the secreted (1), by inserting the
nucleic acids into a host cell and culturing the cell to express the
protein. (1) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54912 to AAK54950 and AAM82169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                             Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cenarchaeum symbiosum; non-thermophilic; crenarchaeote; physiology; characterisation; archae; therapeutic; industrial; laboratory; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 27082 BP; 5963 A; 7786 C; 7711 G; 5622 T; 0 U; 0 Other;

               useful for modulating the susceptibility of an individual to joint space associated with a disease, preferably osteoathritis. The cell line and the non-human animal are useful for screening for an agent for diagnosing an individual having susceptibility to joint space narrowing and/or sosteophyte development and/or joint pain. This sequence corresponds to the polynucleotide encoding a protein listed in the specification. (Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to olfactory receptors (AAG98412-AAG98609) and the genes encoding them (AAH83879-AAH84131) including pseudogenes of 10 primate species, mouse and human. The nucleic acids and receptors may be used in the food processing industry (e.g. for the detection of aromas, quality control and sample analysis), in perfumery (e.g. for the analysis or comparison of perfumes) and in the environment (e.g. for the detection of toxic substances and/or trapping of odours)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding primate and murine olfactory receptors, useful for analysis odors e.g. in food processing and perfumery.

The invention relates to olfactory receptors (AAG98432-AAG98609) and the genes encoding them (AAH83879-AAH84131) including pseudogenes of 10 primate species, mouse and human. The nucleic acids and receptors may be used in the food processing industry (e.g. for the detection of aromas, quality control and sample analysis), in perfumery (e.g. for the analysis or comparison of perfumes) and in the environment (e.g. for the detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding primate and murine olfactory receptors, useful for analysis odors e.g. in food processing and perfumery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New C2GnT-M polypeptides having core 2, core 4 and I branching beta-1-6-N -acetylglucosaminyltransferase activities for preparing reagents useful for diagnosing, preventing or treating inflammation or tumor metastasis.
                                                                                                                                                                                                  New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating cancers such as leukemia and lymphoma.
                                                                                                                                                                                                                                                                                   The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; beta-1-6-N-acetylglucosaminyltransferase; C2GnT-M; inflammation; membrane protein; branched sialyl Lex; L-selectin; immune reaction; inflammation; tissue rejection; tumour metastasis; ss.

The present sequence encodes a beta-1-6-N-acetylglucosaminyltransferase fragment. The full length polypeptide has core2, core4 and I branching activities. It is designated C26AT-M. C26AT-M is a membrane protein that is predominantly expressed in colon, small intestine, trachea, stomach and thyroid, as well as in certain cancer cell lines. C2GAT-M singlypeptides may be used to prepare molecules having highly branched sialyl Lex and Leslectins, which may be subsequently used to modulate immune reactions, e.g. inflammation and tissue rejection, and to prevent or inhibit tumour metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 192 BP; 48 A; 48 C; 51 G; 45 T; 0 U; 0 Other;

Sequence 1972, Application US/09489039A

Patent No. 6610836

GENERAL INFORMATION:
APPLICANT: GATY Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUMBER: OS 109,20489,039A

TITLE REFERENCE: 2709,2004001

CURRENT APPLICATION NUMBER: US/09/489,039A

CURRENT BILING DATE: 2000-01-27

PRIOR APPLICATION NUMBER: US 60/117,747

PRIOR APPLICATION NUMBER: US 60/117,747

SEQ ID NO 1972

Sequence 1, Application US/1082757

Publication No. US20050004071A1

AERERAL INFORMATION:
APPLICANT: Comper, Wayne

TITLE OF INVENTION: Charged Polysaccharides Resistant To Lysosomal Degradation During

TITLE OF INVENTION: Prevent Infection And Renal Passage And Their Use To Treat Or

TITLE OF INVENTION: Prevent Infection By Coronaviruses

FILE REFERENCE: 112.13-007-999

CURRENT APPLICATION NUMBER: US/10/827,757

CURRENT PILING DATE: 2004-04-20

PRIOR FILING DATE: 2003-04-21

Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA).
This is a long-transcript enriched cDNA library (Ref
Genome Ress. 11: 1553-1558 (2001). [PMID: 11544199]). Total
RNAs were extracted from a pool of 1488 unfertilized eggs.
Double-stranded cDNAs were synthesized with an Oligo(dT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

/note="Vector: pT7T3-Pac; Site 1: EcoRI; Site 2: NotI; PolyA-selected mRNA was prepared from unfertilized Xenopus laevis eggs. The library was constructed in the vector pT7T3-Pac as described in Bonaldo, M.F., Lennon, G. and Soares, M.B. 'Normalization and subtraction: two approaches to facilitate gene discovery', Genome Research 6:791-806, 1996. The first strand synthesis used a NotI-dT18 primer; double stranded oDNAs were ligated to EcoRI adapters, disested with NotI, and directionally cloned into the NotI and EcoRI-digested pT7T3-Pac vector. The library contained approximately 7.2 X 10^5 recombinants, with average insert sizes of 1-1.5 kb."
